

The first HTML page designed for this project was the main page. This page required several different aspects of design. First linked the CSS page to the HTML for design of the page. This is done using href= . Beyond that we started with the actual fundamentals of the page.

First, the delivery form. The delivery form has a couple of boxes that won't allow a user to hit submit unless the proper information is filled out. Upon ordering, the user is directed to a new page, confirming the order. The parameters are set in html and will not allow users to move on without these qualifications being met.

In order to create a design to draw people in, the first page has pictures of some of the hardworking people that work in the business. This was done by using the image address and img src to have the picture uploaded.

Using href we were able to link the other two pages to the home page. These create clickable items to move the user to the next desired page. There is the review page and there is the menu page. The review page, allows the user to go back to the homepage and/or go to the menu page(page #3). This page prompts the user to submit a review with a couple of dropdown boxes with comment sections and allows the user to specify the location they ordered with.

After these two pages there is the option for the menu page. The menu page displays the choices for customers. With a simple suggestion box, the Customer allows the customer to input a suggestion for potential menu items.

Each page is set with a css page that provides text and borders for the items listed on each page. These include the text and border color.
